In the specification:

On page 7, amend paragraph [0017] as follows:

To accomplish vertical extrusion movement of one or more teeth, the flexible, elastic material 21 used to obtain intrusion is replaced by rigid metal extensions connection connecting large wire 24 directly to teeth or to archwire 20. The configuration of these rigid extensions can be in the form of an S or tooth loop as is understood by the practicing orthodontist. Attachment to the tooth can be through the bracket or to large wire 24 utilizing a tube or cap previously attached to large wire 24.
